

Well... where I grew up...

- my connection was 1.5mbps on a good day, with ~200ms ping
- the internet was heavily censored (often unpredictably)
- Google something sketchy and your house goes offline for 30min

Having reliable access to content  
is a privilege that we often take for granted.

I just got tired of links I care about 404ing over time

So I built a tool to archive my Pocket stream automatically

- v0.0.1 released
- Index links now work without nginx url rewrites, archive can now be hosted on github pages
- added setup.sh script & docstrings & help commands
- made Chromium the default instead of Google Chrome (yay free software)
- added [env-variable](https://github.com/hannah98!) configuration (thanks to <https://github.com/hannah98!>)
- renamed from **Pocket Archive Stream** -> **Bookmark Archiver**
- added [Netscape-format](https://github.com/ilvar!) export support (thanks to <https://github.com/ilvar!>)
- added [Pinboard-format](https://github.com/sconeyard!) export support (thanks to <https://github.com/sconeyard!>)
- front-page of HN, oops! apparently I have users to support now 😊?
- added Pocket-format export support

- 
- v0.0.0 released: created Pocket Archive Stream 2017/05/05
