The power of wget is amazing!

```
wget --no-verbose \
        --adjust-extension \
        --convert-links \
        --force-directories \
        --backup-converted \
        --span-hosts \
        --no-parent \
        -e robots=off \
        --restrict-file-names=windows \
        --timeout=60 \
        --warc-file=archive.warc \
        --page-requisites \
        --user-agent="Lalala this is chrome I promise..." \
        --load-cookies="mycookies.txt" \
        --compression=auto \
        --no-check-certificate \
        --no-hsts \
        "https://2019.pygotham.org"
```

DEMO TIME

But it's not perfect...

- How do we handle scripts like Javascript?

- How do we handle REST API requests?

- How do we handle dynamic content like video & games?

- Single Page Apps are the worst, plz stop building them

- How do we make sure it works long-term?
